# Introduction

The GeoScript Groovy Cookbook contains short recipes on how to use the GeoScript Groovy library.

GeoScript is a geospatial library written in Groovy. It provides modules for working with geometries, projections, features, layers, rasters, styles, rendering, and tiles. It is built on top of the Java Topology Suite (JTS) and GeoTools libraries. GeoScript Groovy is open source and licensed under the MIT license.

## Using GeoScript

To use GeoScript Groovy you need Java and Groovy installed and on your PATH. Next, download the latest stable release, the latest in development build, or build the code yourself. Then put the GeoScript Groovy bin directory on your PATH. You are now ready to use GeoScript Groovy!

GeoScript Groovy has three commands:

1. `geoscript-groovy` (which can run Groovy files)

```
Jared-Ericksons-MacBook-Pro:~ jericks$ cat script.groovy
import geoscript.geom.Point

p = new Point(-123.181458, 47.036439)
println p.wkt

poly = p.buffer(2.5)
println poly.wkt

Jared-Ericksons-MacBook-Pro:~ jericks$ geoscript-groovy script.groovy
POINT (-123.181458 47.036439)
POLYGON ((-120.681458 47.036439, -120.72949479899194 46.54871319495968, -120.8717591687218 46.07973041908728, -121.10278396924365 45.647513417450995, -121.41369104703364 45.26867204703363, -121.792532417451 44.95776496924364, -122.22474941908729 44.72674016872178, -122.69373219495968 44.584475798991924, -123.181458 44.536439, -123.66918380504033 44.584475798991924, -124.13816658091272 44.72674016872178, -124.57038358254901 44.95776496924364, -124.94922495296638 45.26867204703363, -125.26013203075637 45.647513417450995, -125.49115683127822 46.07973041908728, -125.63342120100808 46.54871319495968, -125.681458 47.036439, -125.63342120100808 47.52416480504032, -125.49115683127822 47.993147580912726, -125.26013203075637 48.42536458254901, -124.94922495296638 48.80420595296637, -124.57038358254901 49.11511303075637, -124.13816658091272 49.34613783127822, -123.66918380504032 49.48840220100808, -123.181458 49.536439, -122.69373219495968 49.48840220100808, -122.22474941908727 49.34613783127821, -121.792532417451 49.11511303075636, -121.41369104703364 48.80420595296636, -121.10278396924363 48.425364582549, -120.87175916872178 47.99314758091272, -120.72949479899192 47.524164805040314, -120.681458 47.036439))

## geoscript-groovy

The geoscript-groovy command can run scripts file but it can also run inline scripts.

*Convert a shapefile to geojson*

```
geoscript-groovy -e "println new  
geoscript.layer.Shapefile('states.shp').toJSONString()"
```

*Get the Bounds of a Shapefile as a Geometry*

```
geoscript-groovy -e "println new  
geoscript.layer.Shapefile('states.shp').bounds.geometry"
```

*Count the number of Features in a Shapefile*

```
geoscript-groovy -e "println new geoscript.layer.Shapefile('states.shp').count"
```

*Render a Shapefile to an image*

```
geoscript-groovy -e "geoscript.render.Draw.draw(new  
geoscript.layer.Shapefile('states.shp'), out: 'image.png')"
```

*Pipe a Shapefile's geometry to another command line application that buffers each feature*

```
geoscript-groovy -e "new geoscript.layer.Shapefile('states.shp').eachFeature{ println  
it.geom.centroid}" | geom combine | geom buffer -d 1.5
```

*Pipe the results of buffering a point to convert it to KML*

```
echo "POINT (1 1)" | geom buffer -d 10 | geoscript-groovy -e "println  
geoscript.geom.Geometry.fromWKT(System.in.text).kml"
```

## Geometry Recipes

The Geometry classes are in the [geoscript.geom](#) package.

## Bounds Recipes

The Bounds class is in the [geoscript.geom](#) package.

## Creating Bounds

*Create a Bounds from four coordinates (`minx`, `miny`, `maxx`, `maxy`) and a projection.*

```
Bounds bounds = new Bounds(-127.265, 43.068, -113.554, 50.289, "EPSG:4326")
```

Create a `Bounds` from four coordinates (`minx`, `miny`, `maxx`, `maxy`) without a projection. The projection can be set later.

```
Bounds bounds = new Bounds(-127.265, 43.068, -113.554, 50.289)  
bounds.proj = new Projection("EPSG:4326")
```

Create a `Bounds` from a string with commas delimiting `minx`, `miny`, `maxx`, `maxy` and projection values.

```
Bounds bounds = Bounds.fromString("-127.265,43.068,-113.554,50.289,EPGS:4326")
```

Create a `Bounds` from a string with spaces delimiting `minx`, `miny`, `maxx`, `maxy` and projection values.

```
Bounds bounds = Bounds.fromString("12.91992187499998 40.84706035607122 15.99609375  
41.77131167976407 EPSG:4326")
```

## Getting Bounds Properties

Create a Bounds and view it's string representation

```
Bounds bounds = new Bounds(-127.265, 43.068, -113.554, 50.289, "EPSG:4326")
String boundsStr = bounds.toString()
println boundsStr
```

```
(-127.265,43.068,-113.554,50.289,EPSG:4326)
```

Get the minimum x coordinate

```
double minX = bounds.minX
println minX
```

```
-127.265
```

Get the minimum y coordinate

```
double minY = bounds.minY
println minY
```

```
43.068
```

Get the maximum x coordinate

```
double maxX = bounds.maxX
println maxX
```

```
-113.554
```

*Get the maximum y coordinate*

```
double maxY = bounds.maxY  
println maxY
```

50.289

*Get the Projection*

```
Projection proj = bounds.proj  
println proj.id
```

*Get the width*

```
double width = bounds.width  
println width
```

# Combining Schemas

Combining two Schemas results in a Map with two values: schema and fields. The schema property contains the new Schema. The fields property is List of two Maps which both contain a mapping between the fields of the original Schema and the newly created Schema.

Optional arguments to the Schema.addSchema method are:

- postfixAll: Whether to postfix all field names (true) or not (false). If true, all Fields from the this current Schema will have '1' at the end of their name while the other Schema's Fields will have '2'. Defaults to false.
- includeDuplicates: Whether or not to include duplicate fields names. Defaults to false. If a duplicate is found a '2' will be added.
- maxFieldNameLength: The maximum new Field name length (mostly to support shapefiles where Field names can't be longer than 10 characters)

- firstPostfix: The postfix string (default is '1') for Fields from the current Schema. Only applicable when postfixAll or includeDuplicates is true.
- secondPostfix: The postfix string (default is '2') for Fields from the other Schema. Only applicable when postfixAll or includeDuplicates is true.

*Combine two Schemas with no duplicate fields and no postfixes to field names*

```
Schema shopSchema = new Schema("shops", [
    new Field("geom", "Point", "EPSG:4326"),
    new Field("id", "Integer"),
    new Field("name", "String")
])

Schema cafeSchema = new Schema("cafes", [
    new Field("geom", "Point", "EPSG:4326"),
    new Field("id", "Integer"),
    new Field("name", "String"),
    new Field("address", "String")
])

Map result = shopSchema.addSchema(cafeSchema, "business")

Schema combinedSchema = result.schema
println combinedSchema
```

business geom: Point(EPSG:4326), id: Integer, name: String, address: String

```
Map<String, String> shopSchemaFieldMapping = result.fields[0]
println shopSchemaFieldMapping
```

[geom:geom, id:id, name:name]

```
Map<String, String> cafeSchemaSchemaFieldMapping = result.fields[1]
println cafeSchemaSchemaFieldMapping
```

[address:address]

Combine two Schemas with no duplicate fields and postfixes

```
Schema shopSchema = new Schema("shops", [
    new Field("geom", "Point", "EPSG:4326"),
    new Field("id", "Integer"),
    new Field("name", "String")
])

    new Field("geom", "Point", "EPSG:4326"),
    new Field("id", "Integer"),
    new Field("name", "String"),
    new Field("address", "String")
])

Map result = shopSchema.addSchema(cafeSchema, "business", postfixAll: true,
includeDuplicates: false)

Schema combinedSchema = result.schema
println combinedSchema
```

```
business geom: Point(EPSG:4326), id1: Integer, name1: String, id2: Integer, name2: String, address2: String
```

```
Map<String, String> shopSchemaFieldMapping = result.fields[0]
println shopSchemaFieldMapping
```

```

```

iteral></PropertyIsEqualTo></filter>")  
println filter.toString()
```

```
[ soilType = Mollisol ]
```

Create a spatial bounding box Filter from a Bounds

```
Filter filter = Filter.bbox(new Bounds(-102, 43.5, -100, 47.5))  
println filter.toString()
```

```
[ the_geom bbox POLYGON ((-102 43.5, -102 47.5, -100 47.5, -100 43.5, -102 43.5)) ]
```

*Create a spatial contains Filter from a Geometry*

```

## Drawing

The Draw class is an easy way to quickly render a Geometry, a List of Geometries, a Feature, or a Layer to an Image, a File, an OutputStream, or a GUI.

### Drawing to a File or GUI

All of the draw methods take a single required parameter but can also take the following optional parameters:

- style = A Style
- bounds = The Bounds
- size = The size of the canvas ([400,350])
- out = The OutputStream, File, or File name. If null (which is the default) a GUI will be opened.
- format = The format ("jpeg", "png", "gif")
- proj = The Projection

## *Draw a Geometry to a File*

```
File file = new File("geometry.png")
Geometry geometry = new Point(-122.376, 47.587).buffer(0.5)
Draw.draw(geometry,
    style: new Fill("#ffffff") + new Stroke("#b2b2b2", 0.5),
    bounds: new Bounds(-122.876, 47.087, -121.876, 48.087),
    size: [400, 400],
    format: "png",
    proj: "EPSG:4326",
    backgroundColor: "#a5bfdd",
    out: file
)
```

## *Draw a List of Geometries to an OutputStream*

```

## Style Recipes

Styles are found in the [geoscript.style](#) package.

Styles are made up Symbolizers and Composites. A Symbolizer is a particular style like Stroke or Fill. Symbolizers also have methods for controlling the drawing order (zindex), the min and max scale (range), and filtering (where).

## Creating Basic Styles

```
Fill fill = new Fill("#6B8E23")
```

A Composite is simply two or more Symbolizers. So, a Composite would be a combination of a Stroke symbolizer (to style the boundary) and a Fill Symbolizer (to style the interior).

```
Composite composite = new Fill("#6B8E23") + new Stroke("black", 0.75)
```

A Symbolizer can use the where method to restrict which features are styled.

```
Symbolizer symbolizer = new Fill("#ffffcc").where("PEOPLE < 4504128.33") +
    new Fill("#41b6c4").where("PEOPLE BETWEEN 4504128.33 AND 16639804.33") +
    new Fill("#253494").where("PEOPLE > 16639804.33")
```

The `zindex` method is used to order Symbolizers on top of each other. In this recipe we use it to create line casings.

```
Symbolizer symbolizer = new Stroke("black", 2.0).zindex(0) + new Stroke("white", 0.1)  
.zindex(1)
```

The `scale` method is used to create Symbolizers that are dependent on map scale.

```
Symbolizer symbolizer = (new Fill("white") + new Stroke("black", 0.1)) + new Label  
("NAME_1")  
.point(anchor: [0.5, 0.5])  
.polygonAlign("mbr")  
.range(max: 16000000)
```

Workspace workspace = new GeoPackage('src/main/resources/data.gpkg')
Layer countries = workspace.get("countries")
countries.style = style
```

## **Simple Style Reader**

A SimpleStyleReader that can easily create simple Styles using Maps or Strings.

- Fill properties: fill and fill-opacity
- Stroke properties: stroke, stroke-width, stroke-opacity
- Shape properties: shape, shape-size, shape-type
- Label properties: label-size, label-style, label-weight, label-family

*Read a Style with fill and stroke properties from a Simple Style String*

```
String str = "fill=#555555 fill-opacity=0.6 stroke=#555555 stroke-width=0.5"
SimpleStyleReader reader = new SimpleStyleReader()
Style style = reader.read(str)

Workspace workspace = new GeoPackage('src/main/resources/data.gpkg')
Layer countries = workspace.get("countries")
countries.style = style
```

*Read a Style with fill, stroke, and label properties from a Simple Style String*

```
String str = "fill:white stroke=navy label=NAME label-size=10"
SimpleStyleReader reader = new SimpleStyleReader()
Style style = reader.read(str)

Workspace workspace = new GeoPackage('src/main/resources/data.gpkg')
Layer countries = workspace.get("countries")
countries.style = style
```

*Read a Style with shape properties from a Simple Style String*

```
String str = "shape-type=circle shape-size=8 shape=orange"  
SimpleStyleReader reader = new SimpleStyleReader()  
Style style = reader.read(str)  
println style  
  
Workspace workspace = new GeoPackage('src/main/resources/data.gpkg')  
Layer places = workspace.get("places")  
places.style = style
```

*Read a Style with fill and stroke properties from a Simple Style Map*

```
Map map = [
    'fill': '#555555',
    'fill-opacity': 0.6,
    'stroke': '#555555',
    'stroke-width': 0.5
]
SimpleStyleReader reader = new SimpleStyleReader()
Style style = reader.read(map)

Workspace workspace = new GeoPackage('src/main/resources/data.gpkg')
Layer countries = workspace.get("countries")
countries.style = style
```

## Color Table

GeoScript Groovy can read and write color table strings and files. This format can be used with ColorMaps to style Rasters.

*Write a ColorMap to a color table string*

```
ColorMap colorMap = new ColorMap(25, 1820, "BoldLandUse", 5)
ColorTableWriter writer = new ColorTableWriter()
String str = writer.write(colorMap)
println str
```

```
25.0 178 156 195
473.75 79 142 187
922.5 143 146 56
1371.25 193 132 55
1820.0 181 214 177
```

*Read a ColorMap from a color table string*

```
Format format = new GeoTIFF(new File('src/main/resources/pc.tif'))
Raster raster = format.read()
ColorTableReader reader = new ColorTableReader()
ColorMap colorMap = reader.read("""25.0 178 156 195
473.75 79 142 187
922.5 143 146 56

1820.0 181 214 177
""")
raster.style = colorMap
```

## Workspace Recipes

The Workspace classes are in the [geoscript.workspace](#) package.

A Workspace is a collection of Layers. You can create, add, remove, and get Layers. There are many different kinds of Workspaces in GeoScript including Memory, PostGIS, Directory (for Shapefiles), GeoPackage, and many more.

## Using Workspaces

*Create a Workspace*

```
Workspace workspace = new Workspace()
```

## Create a Layer

```
Schema schema = new Schema("cities", [
    new Field("geom", "Point", "EPSG:4326"),
    new Field("id", "Integer"),
    new Field("name", "String")
])
Layer layer = workspace.create(schema)
println layer
```

```
cities
```

## Check whether a Workspace has a Layer by name

```
boolean hasCities = workspace.has("cities")
println hasCities
```

```
true
```

## Get a Layer from a Workspace

```
Layer citiesLayer = workspace.get('cities')
println citiesLayer
```

```
cities
```

## Add a Layer to a Workspace

```
Schema statesSchema = new Schema("states", [
    new Field("geom", "Polygon", "EPSG:4326"),
    new Field("id", "Integer"),
    new Field("name", "String")
])
Layer statesLayer = new Layer("states", statesSchema)
workspace.add(statesLayer)
println workspace.has("states")
```

```
true
```

*Get the names of all Layers in a Workspace*

```
List<String> names = workspace.names  
names.each { String name ->  
    println name  
}
```

*Remove a Layer from a Workspace*

```
workspace.remove("cities")  
println workspace.has('cities')
```

false

*Close the Workspace when you are done*

```
workspace.close()
```

## Using a Directory Workspace

A Directory Workspace is a directory of Shapefiles.

*Create a Directory Workspace*

```
Directory directory = new Directory("src/main/resources/data")  
println directory.toString()
```

Directory[/home/travis/build/jericks/geoscript-groovy-cookbook/src/main/resources/data]

*View the Workspace's format*

```
String format = directory.format  
println format
```

Directory

*View the Workspace's File*

```
File file = directory.file  
println file
```

```
/home/travis/build/jericks/geoscript-groovy-cookbook/src/main/resources/data
```

*View the Workspace's list of Layer names*

```
List names = directory.names  
names.each { String name ->  
    println name  
}
```

states

*Get a Layer by name*

```
Layer layer = directory.get("states")  
int count = layer.count  
println "Layer ${layer.name} has ${count} Features."
```

Layer states has 49 Features.

*Close the Directory when done.*

```
directory.close()
```

### Parameters

- filter: The Filter or Filter String to limit the Features. Defaults to null.
- sort: A List of Lists that define the sort order [[Field or Field name, "ASC" or "DESC"],...]. Not all Layers support sorting!
- max: The maximum number of Features to include
- start: The index of the record to start the cursor at. Together with maxFeatures this simulates paging. Not all Layers support the start index and paging!
- fields: A List of Fields or Field names to include. Used to select only a subset of Fields.

*Read all Feature into a List*

```
Workspace workspace = new GeoPackage("src/main/resources/data.gpkg")
Layer layer = workspace.get("states")
List<Feature> features = layer.features

println "# Features = ${features.size()}"
features.each { Feature feature ->
    println feature["NAME_1"]
}
```

```
# Features = 52
Minnesota
Montana
North Dakota
Hawaii
Idaho
Washington
Arizona
California
Colorado
Nevada
...
```

*Collect values from a Layer's Features*

```
Workspace workspace = new GeoPackage("src/main/resources/data.gpkg")

List<String> names = layer.collectFromFeature { Feature f ->
    f["NAME_1"]
}.sort()

println "# Names = ${names.size()}"
names.each { String name ->
    println name
}
```

```
# Names = 52

District of Columbia
Florida
...
...
```

*Collect values from a Layer's Features with parameters.*

```
Workspace workspace = new GeoPackage("src/main/resources/data.gpkg")
Layer layer = workspace.get("states")
List<String> names = layer.collectFromFeature(
    sort: ["NAME_1"],
    start: 0,
    max: 5,
    fields: ["NAME_1"],
    filter: "NAME_1 LIKE 'M%'") { Feature f ->
    f["NAME_1"]
}

println "# Names = ${names.size()}"
names.each { String name ->
    println name
}
```

```
# Names = 5
Maine
Maryland
Massachusetts
Michigan
Minnesota
```

*Get the first Feature that matches the Filter.*

```
Workspace workspace = new GeoPackage("src/main/resources/data.gpkg")

# Generating Tiles

## Generating Image Tiles

### MBTiles

Generate Image Tiles to a MBTiles file

```
File file = new File("target/world.mbtiles")
MBTiles mbtiles = new MBTiles(file, "World", "World Tiles")

Workspace workspace = new GeoPackage('src/main/resources/data.gpkg')
Layer countries = workspace.get("countries")
countries.style = new Fill("#ffffff") + new Stroke("#b2b2b2", 0.5)
Layer ocean = workspace.get("ocean")
ocean.style = new Fill("#a5bfdd")

ImageTileRenderer renderer = new ImageTileRenderer(mbtiles, [ocean, countries])
TileGenerator generator = new TileGenerator()
generator.generate(mbtiles, renderer, 0, 2)
```

Generate Image Tiles to a GeoPackage file

## GeoPackage

```
File file = new File("target/world.gpkg")
geoscript.layer.GeoPackage geopackage = new geoscript.layer.GeoPackage(file, "World",
Pyramid.createGlobalGeodeticPyramid())

Workspace workspace = new GeoPackage('src/main/resources/data.gpkg')

ImageTileRenderer renderer = new ImageTileRenderer(geopackage, [ocean, countries])
TileGenerator generator = new TileGenerator()
generator.generate(geopackage, renderer, 0, 2)
```

Generate Image Tiles to a TMS directory

## TMS

```
File directory = new File("target/tiles")
directory.mkdir()
TMS tms = new TMS("world", "png", directory, Pyramid.createGlobalMercatorPyramid())

Workspace workspace = new GeoPackage('src/main/resources/data.gpkg')

## Tile Layer

### Tile Layer Properties

Create a TileLayer from an MBTiles File.

```
File file = new File("src/main/resources/tiles.mbtiles")
MBTiles mbtiles = new MBTiles(file)
```

Get the TileLayer's name.

```
String name = mbtiles.name
println name
```

countries

Get the TileLayer's Bounds.

```
Bounds bounds = mbtiles.bounds  
println bounds
```

```
(-2.0036395147881314E7,-  
2.0036395147881314E7,2.0036395147881314E7,2.0036395147881314E7,EPSG:3857)
```

Get the TileLayer's Projection.

```
Projection proj = mbtiles.proj  
println proj
```

```
EPSG:3857
```

Get the TileLayer's Pyramid.

```
Pyramid pyramid = mbtiles.pyramid  
println pyramid
```

```
geoscript.layer.Pyramid(proj:EPSG:3857, bounds:(-2.0036395147881314E7,-

origin:BOTTOM_LEFT, tileSize:256, tileHeight:256)
```

Get a Tile from a TileLayer.

```
Tile tile = mbtiles.get(0, 0, 0)  
println tile
```

```
Tile(x:0, y:0, z:0)
```
