## **Workspace Recipes**

The Workspace classes are in the **geoscript.workspace** package.

A Workspace is a collection of Layers. You can create, add, remove, and get Layers. There are many different kinds of Workspaces in GeoScript including Memory, PostGIS, Directory (for Shapefiles), GeoPackage, and many more.

## **Using Workspaces**

Create a Workspace

```
Workspace workspace = new Workspace()
```

Create a Layer

```
Schema schema = new Schema("cities", [
          new Field("geom", "Point", "EPSG:4326"),
          new Field("id", "Integer"),
          new Field("name", "String")
])
Layer layer = workspace.create(schema)
println layer
```

```
cities
```

Check whether a Workspace has a Layer by name

```
boolean hasCities = workspace.has("cities")
println hasCities
```

```
true
```

Get a Layer from a Workspace

```
Layer citiesLayer = workspace.get('cities')
println citiesLayer
```

```
cities
```

```
true
```

Get the names of all Layers in a Workspace

```
List<String> names = workspace.names
names.each { String name ->
    println name
}
```

```
Shapefile
H2 (JNDI)
MySQL (JNDI)
PostGIS (JNDI)
Geobuf
MySQL
PostGIS
Directory of spatial files (shapefiles)
SpatiaLite (JNDI)
Web Feature Server (NG)
Properties
H2
GeoPackage
```

Remove a Layer from a Workspace

```
workspace.remove("cities")
println workspace.has('cities')
```

```
false
```

Close the Workspace when you are done

```
workspace.close()
```

## **Using a Directory Workspace**

A Directory Workspace is a directory of Shapefiles.

Create a Directory Workspace

```
Directory directory = new Directory("src/main/resources/data")
println directory.toString()
```

```
Directory[/home/travis/build/jericks/geoscript-groovy-
cookbook/src/main/resources/data]
```

View the Workspace's format

```
String format = directory.format println format
```

```
Directory
```

View the Workspace's File

```
File file = directory.file println file
```

/home/travis/build/jericks/geoscript-groovy-cookbook/src/main/resources/data

View the Workspace's list of Layer names

```
List names = directory.names
names.each { String name ->
    println name
}
```

```
states
```

Get a Layer by name

```
Layer layer = directory.get("states")
int count = layer.count
println "Layer ${layer.name} has ${count} Features."
```

```
Layer states has 49 Features.
```

Close the Directory when done.

```
directory.close()
```

## **Investigating Workspaces**

Get available Workspace names

```
List<String> names = Workspace.getWorkspaceNames()
names.each { String name ->
    println name
}
```

```
Shapefile
H2 (JNDI)
MySQL (JNDI)
PostGIS (JNDI)
Geobuf
MySQL
PostGIS
Directory of spatial files (shapefiles)
SpatiaLite (JNDI)
Web Feature Server (NG)
Properties
H2
GeoPackage
```

Get parameters for a Workspace

```
List<Map> parameters = Workspace.getWorkspaceParameters("GeoPackage")
parameters.each { Map param ->
    println "Parameter = ${param.key} Type = ${param.type} Required?
${param.required}"
}
```

```
Parameter = dbtype Type = java.lang.String Required? true
Parameter = database Type = java.io.File Required? true
Parameter = user Type = java.lang.String Required? false
Parameter = passwd Type = java.lang.String Required? false
Parameter = namespace Type = java.lang.String Required? false
Parameter = Expose primary keys Type = java.lang.Boolean Required? false
Parameter = max connections Type = java.lang.Integer Required? false
Parameter = min connections Type = java.lang.Integer Required? false
Parameter = fetch size Type = java.lang.Integer Required? false
Parameter = Batch insert size Type = java.lang.Integer Required? false
Parameter = Connection timeout Type = java.lang.Integer Required? false
Parameter = validate connections Type = java.lang.Boolean Required? false
Parameter = Test while idle Type = java.lang.Boolean Required? false
Parameter = Evictor run periodicity Type = java.lang.Integer Required? false
Parameter = Max connection idle time Type = java.lang.Integer Required? false
Parameter = Evictor tests per run Type = java.lang.Integer Required? false
Parameter = Primary key metadata table Type = java.lang.String Required? false
Parameter = Session startup SQL Type = java.lang.String Required? false
Parameter = Session close-up SQL Type = java.lang.String Required? false
Parameter = Callback factory Type = java.lang.String Required? false
```

## **Creating Workspaces**

### Creating a Workspace from a connection string

You can create a Workspace from a connection string that contains paramters in key=value format with optional single quotes.

Create a Shapefile Workspace

```
String connectionString = "url='states.shp' 'create spatial index'=true"
Workspace workspace = Workspace.getWorkspace(connectionString)
```

Create a GeoPackage Workspace

```
connectionString = "dbtype=geopkg database=layers.gpkg"
workspace = Workspace.getWorkspace(connectionString)
```

Create a H2 Workspace

```
connectionString = "dbtype=h2 database=layers.db"
workspace = Workspace.getWorkspace(connectionString)
```

## Creating a Workspace from a connection map

You can create a Workspace from a connection map that contains paramters.

#### Create a H2 Workspace

```
Map params = [dbtype: 'h2', database: 'test.db']
Workspace workspace = Workspace.getWorkspace(params)
```

#### Create a PostGIS Workspace

```
params = [
   dbtype: 'postgis',
   database: 'postgres',
   host: 'localhost',
   port: 5432,
   user: 'postgres',
   passwd: 'postgres'
]
workspace = Workspace.getWorkspace(params)
```

#### Create a GeoBuf Workspace

```
params = [file: 'layers.pbf', precision: 6, dimension:2]
workspace = Workspace.getWorkspace(params)
```

### **Creating Directory Workspaces**

Create a Directory Workspace from a directory name

```
Workspace workspace = new Directory("src/main/resources/shapefiles")
println workspace.format
println "-----"
workspace.names.each { String name ->
    println "${name} (${workspace.get(name).count})"
}
```

```
Directory
-----
ocean (2)
countries (177)
```

Create a Directory Workspace from a File directory

```
Workspace workspace = new Directory(new File("src/main/resources/shapefiles"))
println workspace.format
println "-----"
workspace.names.each { String name ->
    println "${name} (${workspace.get(name).count})"
}
```

```
Directory
-----
ocean (2)
countries (177)
```

Create a Directory Workspace from a URL

```
Directory directory = Directory.fromURL(
    new URL
("http://www.naturalearthdata.com/http//www.naturalearthdata.com/download/110m/cultura
l/ne_110m_admin_0_countries.zip"),
    new File("naturalearth")
)
println directory.format
println "------"
directory.names.each { String name ->
    println "${name} (${directory.get(name).count})"
}
```

```
Directory
-----
ne_110m_admin_0_countries (177)
```

### **Creating GeoPackage Workspaces**

Create a GeoPackage Workspace from a file name

```
Workspace workspace = new GeoPackage("src/main/resources/data.gpkg")
println workspace.format
println "-----"
workspace.names.each { String name ->
    println "${name} (${workspace.get(name).count})"
}
```

```
GeoPackage
-----
countries (177)
ocean (2)
places (326)
rivers (460)
states (52)
```

```
Workspace workspace = new GeoPackage(new File("src/main/resources/data.gpkg"))
println workspace.format
println "-----"
workspace.names.each { String name ->
    println "${name} (${workspace.get(name).count})"
}
```

```
GeoPackage
------
countries (177)
ocean (2)
places (326)
rivers (460)
states (52)
```

### **Creating H2 Workspaces**

Create a H2 Workspace from a File

```
Workspace workspace = new H2(new File("src/main/resources/h2/data.db"))
println workspace.format
println "--"
workspace.names.each { String name ->
    println "${name} (${workspace.get(name).count})"
}
```

```
H2
--
countries (177)
ocean (2)
places (326)
states (52)
```

### **Creating Geobuf Workspaces**

Create a Geobuf Workspace from a File

```
Workspace workspace = new Geobuf(new File("src/main/resources/geobuf"))
println workspace.format
println "-----"
workspace.names.each { String name ->
    println "${name} (${workspace.get(name).count})"
}
```

```
Geobuf
-----
countries (177)
ocean (2)
places (326)
```

## **Creating Property Workspaces**

Create a Property Workspace from a File

```
Workspace workspace = new Property(new File("src/main/resources/property"))
println workspace.format
println "-----"
workspace.names.each { String name ->
    println "${name} (${workspace.get(name).count})"
}
```

```
Property
-----
circles (10)
places (10)
```
