Process Recipes

The Process classes are in the **geoscript.process** package.

Execute a built-in Process

Create a Process from a built-in process by name

```
Process process = new Process("vec:Bounds")
String name = process.name
println name
```

vec:Bounds

Get the title

```
String title = process.title println title
```

Bounds

Get the description

String description = process.description println description

Computes the bounding box of the input features.

Get the version

```
String version = process.version println version
```

1.0.0

Get the input parameters

Map parameters = process.parameters
println parameters

```
[features:class geoscript.layer.Cursor]
```

Get the output parameters

```
Map results = process.results println results
```

```
[bounds:class geoscript.geom.Bounds]
```

Execute the Process to calculate the bounding box of all Features in a Layer

```
Workspace workspace = new GeoPackage('src/main/resources/data.gpkg')
Layer layer = workspace.get("places")
Map executeResults = process.execute([features: layer])
Bounds bounds = executeResults.bounds
```

Listing built-in Processes

Get the names of all built-in Processes

```
List<String> processes = Process.processNames
processes.each { String name ->
    println name
}
```

```
vec:Aggregate
vec:BarnesSurface
vec:Bounds
```

vec:BufferFeatureCollection

vec:Centroid vec:ClassifyByRange vec:Clip vec:CollectGeometries vec:Count vec:Feature vec:FeatureClassStats vec:Grid vec:Heatmap vec:InclusionFeatureCollection vec:IntersectionFeatureCollection vec:LRSGeocode vec:LRSMeasure vec:LRSSegment vec:Nearest vec:PointBuffers vec:PointStacker vec:Query vec:RectangularClip vec:Reproject vec:Simplify vec:Snap vec:Transform vec:UnionFeatureCollection vec:Unique vec:VectorToRaster vec:VectorZonalStatistics geo:union geo:intersection geo:getX geo:getY geo:isValid geo:buffer geo:difference geo:reproject geo:splitPolygon geo:within geo:touches geo:convexHull geo:area qeo:crosses geo:symDifference geo:distance geo:boundary geo:centroid geo:interiorPoint geo:getGeometryN geo:overlaps geo:isSimple geo:isWithinDistance geo:relate

geoscript:convexhull
```

Executing a new Process

```
geoscript:convexhull
```

Get the title

```
String title = process.title
println title
```

convexhull

Get the description

```
String description = process.description println description
```

Create a convexhull around the features

Get the version

```
String version = process.version println version
```

1.0.0

Get the input parameters

```
Map parameters = process.parameters println parameters
```

```
[features:class geoscript.layer.Cursor]
```

Get the output parameters

```
Map results = process.results println results
```

```
[result:class geoscript.layer.Cursor]
```

Execute the Process created from a Groovy Closure

```
Workspace workspace = new GeoPackage('src/main/resources/data.gpkg')
Layer layer = workspace.get("places")
Map executeResults = process.execute([features: layer.cursor])
Cursor convexHullCursor = executeResults.result
```

Process Functions

Process Functions are a combination of Functions and Processes that can be used to create rendering transformations.

```
Workspace workspace = new GeoPackage('src/main/resources/data.gpkg')
Layer places = workspace.get("places")
Process process = new Process("convexhull",
        "Create a convexhull around the features",
        [features: geoscript.layer.Cursor],
        [result: geoscript.layer.Cursor],
        { inputs ->
            def geoms = new GeometryCollection(inputs.features.collect{ f -> f.geom})
            def output = new Layer()
            output.add([geoms.convexHull])
            [result: output]
        }
Function function = new Function(process, new Function("parameter", new Expression
("features")))
Symbolizer symbolizer = new Transform(function, Transform.RENDERING) + new Fill
("aqua", 0.75) + new Stroke("navy", 0.5)
places.style = symbolizer
```

Create a ProcessFunction from a Process that converts geometries in a Layer into a bounds.

```
Workspace workspace = new GeoPackage('src/main/resources/data.gpkg')
Layer places = workspace.get("places")
Process process = new Process("bounds",
        "Create a bounds around the features",
        [features: geoscript.layer.Cursor],
        [result: geoscript.layer.Cursor],
        { inputs ->
            def geoms = new GeometryCollection(inputs.features.collect{ f -> f.geom})
            def output = new Layer()
            output.add([geoms.bounds.geometry])
            [result: output]
        }
ProcessFunction processFunction = new ProcessFunction(process, new Function
("parameter", new Expression("features")))
Symbolizer symbolizer = new Transform(processFunction, Transform.RENDERING) + new
Fill("aqua", 0.75) + new Stroke("navy", 0.5)
places.style = symbolizer
```
